Annex A/Chapter 08

ANNEX A to the

Proposal for a

REGULATION OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL

on the European System of national and regional accounts in the European Union

ANNEX A

CHAPTER 8: THE SEQUENCE OF ACCOUNTS

INTRODUCTION

This chapter sets out the details of the accounts and balance sheets in the national accounts' sequence of accounts. It also sets out the interactions of the domestic economy with the rest of the world in the same sequence. The goods and services account is also described, reflecting the accounting identity underlying the supply and use of goods and services. Finally it presents the integrated set of economic accounts where each sector is shown in the same account with an aggregated form of account entries.

The sequence of accounts

- 8.01 The ESA records flows and stocks in an ordered set of accounts describing the economic cycle from production and the generation of income, through its distribution and redistribution, and its use for final consumption. Finally the ESA records the use of what is left in the form of saving to provide for the accumulation of assets, both non-financial and financial.
- 8.02 Each of the accounts shows resources and uses, which are brought to a balance by the introduction of a balancing item, usually on the uses' side of the account. The balancing item is taken forward to the next account as the first entry on the resources side.
- 8.03 The structured recording of transactions according to a logical analysis of economic life provides the aggregates required for the study of an institutional sector or sub-sector, or the total economy. The breakdown of the accounts is designed to reveal the most significant economic information, and the balancing item of each account is a key element in the information revealed.
- 8.04 The accounts are grouped in three categories:
 - (a) Current accounts cover production and the associated generation, distribution and redistribution of income and its use in the form of final consumption. The income not directly used for final consumption is revealed in the balancing item saving, which is taken forward to the accumulation accounts as the first entry on the resources side of the capital account;
 - (b) Accumulation accounts analyse changes in the assets and liabilities of the units and enable changes in net worth (the difference between assets and liabilities) to be recorded;
 - (c) Balance sheets show the total assets and liabilities at the beginning and the end of the accounting period, together with the net worth. The

flows for each asset and liability item recorded in the accumulation accounts are seen again in the changes in balance sheets account.

- 8.05 The sequence of accounts applies to institutional units, institutional sectors and sub-sectors, and the total economy.
- 8.06 The balancing items are established both gross and net. They are gross if calculated before deduction of consumption of fixed capital and net if calculated after this deduction. It is more significant to express income balancing items in net terms, as consumption of capital is a call on disposable income which must be met if the capital stock of the economy is to be maintained.
- 8.07 The accounts are presented in two ways:
- (a) in the form of integrated economic accounts, showing the accounts for all the institutional sectors, the total economy and the rest of the world in a single table;
 - (b) in the form of a sequence of accounts, giving more detailed information. The tables showing the presentation of each account are given in the section of this chapter entitled 'Sequence of accounts'.
- 8.08 Table 8.1 shows a synoptic presentation of the accounts, balancing items and main aggregates: The code for the main aggregates is not shown in the table, but is the same as the code for the balancing items, but with the addition of an asterisk after the number. For example for the Balance of primary incomes, the code is B.5g and the equivalent code of the main aggregate Gross National Income is B.5*g.
- 8.09 The balancing items are shown in the table in their gross form, and indicated as such by the use of "g" in the code. For each such code there is a net form, where the estimate for capital consumption has been deducted. For example, value added, gross has a code of B.1g, and the net equivalent (value added, net) where capital consumption has been deducted, is B.1n.

SEQUENCE OF ACCOUNTS

CURRENT ACCOUNTS

Production account (I)

- 8.10 The production account (I) shows the transactions relating to the production process. It is drawn up for institutional sectors and for industries. Its resources include output and its uses include intermediate consumption.
- 8.11 The production account reveals one of the most important balancing items in the system — value added, or the value generated by any unit engaged in a production activity — and a vital aggregate: gross domestic product. Value added is economically significant for both the institutional sectors and the industries.
- 8.12 Value added (the balancing item of the account) may be calculated before or after allowing for the consumption of fixed capital, i.e. gross or net. Given that output is valued at basic prices and intermediate consumption at purchasers' prices, value added does not include taxes less subsidies on products.
- 8.13 The production account at the level of the total economy includes in resources, in addition to the output of goods and services, taxes less subsidies on products. It thus enables gross domestic product (at market prices) to be obtained as a balancing item. The code for this key aggregate balancing item, value added at whole economy level adjusted to be at market prices, is B.1*g and this is GDP at market prices. Net domestic product (NDP) code is B.1*n.
- 8.14 Financial intermediation services indirectly measured (FISIM) are allocated to users as costs. This requires part of interest payments to financial intermediaries to be reclassified as payments for services, and allocated as output of the financial intermediation producers. An equivalent value is identified as consumption of users. The value of GDP compared to ESA 95 measure, is affected by the amount of FISIM allocated to final consumption, exports and imports.

Distribution and use of income accounts (II)

- 8.15 Distribution and use of income are analysed in four stages: primary distribution, secondary distribution, redistribution in kind and use of income.

The first stage concerns the generation of income resulting directly from the production process and its distribution between the production factors (labour, capital) and general government (via taxes on production and imports, and subsidies). It enables the operating surplus (or mixed income in the case of households) and primary income to be determined.

The second stage traces redistribution of income via transfers, other than social transfers in kind and capital transfers. This yields the disposable income as the balancing item.

For the third stage, individual services provided by government and NPISHs to society are treated as part of household final consumption, and a corresponding income imputed to households. This is achieved through two accounts with adjusted items. An account is introduced called the redistribution of income in kind account, which shows in the resources the imputed extra income for households, and a corresponding use for government and NPISHs as the imputed transfer from these sectors. This gives a balancing item called the adjusted disposable income, which is identical to disposal income at the whole economy level, but different for the sectors of households, government and NPISHs.

In the fourth stage, the disposable income is taken forward to the next account, the use of disposable income account and this shows how the income is consumed, leaving saving as the balancing item. When individual services are recognised as consumption by households through the redistribution in kind account, the use of adjusted disposable income in kind account shows how this measure of adjusted disposable income is spent by households on the social transfers in kind received from government and NPISHs, by adding the value of the social transfers in kind to household final consumption to give a measure called actual final consumption. The consumption for government and NPISHs is reduced by an equal and opposite amount, so that when saving is calculated for the government, NPISHs and household sectors, the adjusted treatment gives the same balancing item of saving for each sector as the standard treatment.

Primary distribution of income accounts (II.1)

Generation of income account (II.1.1)

The layout of the generation of income account by institutional sector is as shown in the table 8.3.

- 8.16 The generation of income account is also presented by industries, in the columns of the supply and use tables.

- 8.17 The generation of income account presents the transactions of primary income from the point of view of the source sectors, rather than the destination sectors.
- 8.18 It shows how value added covers compensation of employees and other taxes (less subsidies) on production. The balancing item is operating surplus, which is the surplus (or deficit) on production activities before account has been taken of the interest, rents or charges which the production unit
- (a) must pay on financial assets or on natural resources - which it has borrowed or rented;
 - (b) must receive on financial assets or on natural resources of which it is the owner.
- 8.19 In the case of unincorporated enterprises in the households sector, the balancing item of the generation of income account implicitly contains an element corresponding to remuneration for work carried out by the owner or members of the family. This income from self-employment has characteristics of wages and salaries, and characteristics of profit due to work carried out as an entrepreneur. This income, neither strictly wages nor profits alone, is referred to as 'mixed income'.
- 8.20 In the case of own account production of housing services by owner-occupier households, the balancing item of the generation of income account is operating surplus (and not mixed income).

Table 8.3 Account II.1.1: Generation of income account (continued)

[illegible]

Allocation of primary income account (II.1.2)

- 8.21 Unlike the generation of income account, the allocation of primary income treats the resident units and institutional sectors as recipients rather than producers of primary income.
- 8.22 'Primary income' is the income which resident units receive by virtue of their direct participation in the production process, and the income receivable by the owner of a financial asset or a natural resource in return for providing funds to, or putting the natural resource at the disposal of, another institutional unit.
- 8.23 For the household sector, compensation of employees (D.1) as a resource in the allocation of primary income account is not the same as the D.1 entry as a use in the generation of income account. In the household generation of income account, the use entry shows how much is paid to staff employed in the household business. In the household sector allocation of primary income account, the entry in the resources side shows all the compensation from employment earned by the household sector working as an employee in business, the government etc. So the entry in the allocation account for households is much bigger than the entry in the household sector generation account.
- 8.24 The allocation of primary income account (II.1.2) can be calculated only for the institutional sectors and sub-sectors because, in the case of industries, it is impossible to break down certain flows connected with financing (capital loans and borrowings) and assets.
- 8.25 The allocation of primary income account is broken down into an entrepreneurial income account (II.1.2.1) and an allocation of other primary income account (II.1.2.2).

Entrepreneurial income account (II.1.2.1)

- 8.26 The purpose of the entrepreneurial income account is to determine a balancing item corresponding to the concept of current profit before distribution and income tax, as normally used in business accounting.
- 8.27 In the case of general government and non-profit institutions serving households, this account concerns only their market activities.
- 8.28 Entrepreneurial income corresponds to the operating surplus or mixed income (on the resources side):

plus property income receivable in connection with financial and other assets belonging to the enterprise (on the resources side);

minus interest on debts payable by the enterprise, other investment income payable, and rents payable on land and other natural resources rented by the enterprise (on the uses side).

Property income payable in the form of dividends, withdrawals of income from quasi-corporations, or reinvested earnings on foreign direct investment, are not deducted from entrepreneurial income.

Allocation of other primary income account (II.1.2.2)

- 8.29 The purpose of the allocation of other primary income account is to return from the concept of entrepreneurial income to the concept of primary income. It therefore contains the elements of primary income not included in the entrepreneurial income account:
- (a) in the case of corporations, distributed dividends, withdrawals of income from quasi-corporations, and reinvested earnings on foreign direct investment (on the uses side);
 - (b) in the case of households:
 - 1. property income payable, excluding rents and interest payable in connection with the entrepreneurial activity (on the uses side);
 - 2. compensation of employees (on the resources side);
 - 3. property income receivable, excluding that receivable in connection with the activity of the enterprise (on the resources side);
 - (c) in the case of general government:
 - 1. property income payable, excluding that payable in connection with market activities (on the uses side);
 - 2. taxes on production and imports less subsidies (on the resources side);

3. property income receivable, excluding that receivable in connection with market activities (on the resources side).

Secondary distribution of income account (II.2)

- 8.30 The secondary distribution of income account shows how the balance of the primary income of an institutional sector is allocated by redistribution: current taxes on income, wealth etc., social contributions and benefits (excluding social transfers in kind) and other current transfers.
- 8.31 The balancing item of the account is disposable income, which reflects current transactions and is the amount available for final consumption or savings.
- 8.32 Social contributions are recorded on the uses side of the secondary distribution of income account of households and on the resources side of the secondary distribution of income account of the institutional sectors responsible for management of social insurance. When payable by employers for their employees, they are first included under compensation of employees, on the uses side of the employers' generation of income account, since they form part of wage costs; they are also recorded, as compensation of employees, on the resources side of the households' allocation of primary income account, since they correspond to benefits to households.

The social contributions shown on the uses side of the secondary distribution of income account of households are net of the service charges of the pension funds and other insurance companies, all or part of whose resources are made up of actual social contributions.

An adjustment item is shown in the table for the social insurance scheme service charges. Net social contributions (D.61) are recorded net of these charges, but as it is difficult to apportion it across the components of D.61, these are shown gross of these charges in the table. So D.61 is the sum of its components, less this adjustment item.

Redistribution of income in kind account (II.3)

- 8.33 The redistribution of income in kind account gives a broader picture of households' income by including the flows corresponding to the use of individual goods and services which these households receive free of charge from government and NPISHs, i. e. social transfers in kind. This facilitates comparisons over time when there are differences or changes in economic and social conditions, and supplements the analysis of the role of general government in the redistribution of income.
- 8.34 Social transfers in kind are recorded on the resources side of the redistribution of income in kind account in the case of households, and on the uses side in the case of general government and non-profit institutions serving households.
- 8.35 The balancing item in the redistribution of income in kind account is adjusted disposable income, and this is the first entry on the resources side of the use of adjusted disposable income account (II.4.2).

Use of income account (II.4)

- 8.36 For the institutional sectors with final consumption, the use of income account shows how disposable income (or adjusted disposable income) is divided between final consumption expenditure (or actual final consumption) and saving.
- 8.37 In the system, only government, NPISHs and households have final consumption. In addition, the use of income account includes, for households and for pension funds, an adjustment item (D.8 adjustment for the change in pension entitlements) which relates to the way that transactions between households and pension funds are recorded. This is explained in the chapter on distributive transactions, paragraph 4.141.

Use of disposable income account (II.4.1)

- 8.38 The use of disposable income account includes the concept of final consumption expenditure financed by the various sectors concerned: households, general government, and non-profit institutions serving households.
- 8.39 The balancing item in the use of disposable income account is saving.

Use of adjusted disposable income account (II.4.2)

- 8.40 This account links with the redistribution of income in kind account (II.3). The use of adjusted disposable income account includes the concept of actual final consumption, which corresponds to the value of goods and services actually at the disposal of households for final consumption, even if their acquisition is financed by general government or non-profit institutions serving households.
- Consequently, the actual final consumption of general government and NPISHs corresponds only to collective final consumption.
- 8.41 At the level of the total economy, final consumption expenditure and actual final consumption are equal; it is only the distribution over the institutional sectors which differs. The same is true of disposable income and adjusted disposable income.
- 8.42 Saving is the balancing item in both versions of the use of income account. Its value is identical for all sectors, regardless of whether it is obtained by subtracting final consumption expenditure from disposable income, or by subtracting actual final consumption from adjusted disposable income.
- 8.43 Saving is the (positive or negative) amount resulting from current transactions which establishes the link with accumulation. If saving is positive, non-spent income is used for the acquisition of assets or for paying off liabilities. If saving is negative, certain assets are liquidated or certain liabilities increase.

ACCUMULATION ACCOUNTS (III)

- 8.44 The accumulation accounts are flow accounts. They record the various causes of changes in the assets and liabilities of units and the change in their net worth.
- 8.45 Changes in assets are recorded on the left-hand side of the accounts (plus or minus), changes in liabilities and net worth on the right-hand side (plus or minus).

Capital account (III.1)

- 8.46 The capital account records acquisitions less disposals of non-financial assets by resident units and measures the change in net worth due to saving (final balancing item in the current accounts) and capital transfers.
- 8.47 The capital account makes it possible to determine the extent to which acquisitions less disposals of non-financial assets have been financed out of saving and by capital transfers. It shows a net lending corresponding to the amount available to a unit or sector for financing, directly or indirectly, other units or sectors, or a net borrowing corresponding to the amount which a unit or sector is obliged to borrow from other units or sectors.

Change in net worth due to saving and capital transfers account (III.1.1)

- 8.48 This account makes it possible to determine the change in net worth due to saving and capital transfers, which corresponds to net saving plus capital transfers receivable, minus capital transfers payable.

Acquisitions of non-financial assets account (III.1.2)

- 8.49 This account records acquisitions less disposals of non-financial assets in order to return from the concept of change in net worth due to saving and capital transfers to net lending or borrowing.

Financial account (III.2)

- 8.50 The financial account records, by type of financial instrument, the changes in the financial assets and liabilities that compose net lending or borrowing. As these should match the financial surplus or deficit balancing items of the capital account, carried forward to this account as the first entry on the changes in liabilities and net worth side, there is no balancing item in this account.
- 8.51 The classification of assets and liabilities used in the financial account is identical to that used in the balance sheets.

Other changes in assets account (III.3)

- 8.52 The other changes in assets account records changes in assets and liabilities of units, other than in connection with saving and voluntary transfers of wealth, these being recorded in the capital and financial accounts. It is divided into two: the other changes in volume of assets account (III.3.1) and the revaluation account (III.3.2).

Other changes in volume of assets account (III.3.1)

- 8.53 The movements recorded in the other changes in volume of assets account affect the net worth of the balance sheets of the units, sectors and sub-sectors concerned. This change, called change in net worth due to other changes in volume of assets, is the balancing item in the account.

Revaluation account (III.3.2)

- 8.54 The revaluation account records changes in the value of assets and liabilities due to changes in their prices.

For a given asset or liability, this change is measured as:

- (a) either the difference between its value at the end of the accounting period and its value at the start of the accounting period or the date on which it was first entered in the balance sheet;
- (b) or the difference between its value at the date on which it was written out of the balance sheet and its value at the start of the accounting period or the date on which it was first entered in the balance sheet.

This difference is called ‘nominal holding gain (or loss)’.

A nominal holding gain corresponds to the positive revaluation of an asset or the negative revaluation of a (financial) liability.

A nominal holding loss corresponds to the negative revaluation of an asset or the positive revaluation of a (financial) liability.

- 8.55 The flows recorded in the revaluation account change the net worth of the balance sheets of the units concerned. This change, called ‘change in net worth due to nominal holding gains and losses’, is the balancing item in the account. It is recorded on the changes in liabilities and net worth side.
- 8.56 The revaluation account is broken down into two sub-accounts: the neutral holding gains and losses account (III.3.2.1) and the real holding gains and losses account (III.3.2.2).

Neutral holding gains and losses account (III.3.2.1)

- 8.57 The neutral holding gains and losses account records changes in the value of assets and liabilities in proportion to changes in the general price level. Such changes correspond to the revaluation necessary to maintain the general

purchasing power of assets and liabilities. The general price index to be applied for this calculation is the price index for final national uses, excluding changes in inventories.

Real holding gains and losses account (III.3.2.2)

8.58 Real holding gains and losses measure the difference between nominal holding gains and losses and neutral holding gains and losses.

8.59 If the nominal holding gains net of the nominal holding losses on a given asset exceed the neutral holding gains net of the neutral holding losses, there is a real holding gain on the asset for the unit holding it. This gain reflects the fact that the actual price of the asset has, on average, risen faster than the general price level. Conversely, a drop in the relative price of the asset produces a real holding loss for the unit holding it.

By the same token, a rise in the relative price of a liability produces a real holding loss on liabilities, while a drop in the relative of a liability generates a real holding gain on liabilities.

BALANCE SHEETS (IV)

8.60 The aim of the balance sheets is to give a picture of the assets, liabilities and net worth of units at the start and end of the accounting period and of changes between balance sheets. The sequence is as follows:

- (a) opening balance sheet (IV.1);
- (b) changes in balance sheet (IV.2);
- (c) closing balance sheet (IV.3).

Opening balance sheet (IV.1)

8.61 The opening balance sheet records the value of assets and liabilities held by units at the start of the accounting period.

These items are categorised on the basis of the classification of assets and liabilities.

They are valued at prices current at the start of the accounting period. The difference between assets and liabilities — the balancing item in the account — is the net worth at the start of the accounting period.

Changes in balance sheet (IV.2)

8.62 The changes in balance sheet account records changes in the value of assets and liabilities in the course of the accounting period and aggregates the amounts recorded in the various accumulation accounts, i. e. change in net worth due to saving and capital transfers, change in net worth due to other volume changes in assets and change in net worth due to nominal holding gains and losses.

Closing balance sheet (IV.3)

8.63 The closing balance sheet records the value of assets and liabilities held by units at the end of the accounting period. These items are categorised on the basis of the same classification used in the opening balance sheet and are valued at prices current at the end of the period.

The difference between assets and liabilities is the net worth at the end of the accounting period.

8.64 The value of an asset or liability in the closing balance sheets is equal to the sum of its value in the opening balance sheets and the amount recorded for the said item in the changes in balance sheet account.

REST OF THE WORLD ACCOUNTS (V)

- 8.65 The rest of the world accounts record transactions between resident and non-resident units. The rest of the world does not constitute an institutional sector as such, but in the structure of the system it plays a similar role.
- 8.66 The sequence of rest of the world accounts follows the same general pattern as the institutional sector accounts, i. e.:
- (a) current accounts,
 - (b) accumulation accounts,
 - (c) balance sheets.
- 8.67 These accounts are drawn up from the point of view of the rest of the world. Thus, what is a resource for the rest of the world is a use for the total economy and vice versa. By the same token, a financial asset held by the rest of the world is a liability for the total economy and vice versa). An exception is gold bullion held as reserve assets, which despite having no counterpart liability, are recorded in the financial account because of their role in international payments.

CURRENT ACCOUNTS

External account of goods and services (V.I)

- 8.68 Imports of goods and services are recorded on the resources side of the account and exports of goods and services on the uses side. The difference between resources and uses is the balancing item in the account, called 'external balance of goods and services'. If it is positive, there is a surplus for the rest of the world and a deficit for the total economy and vice versa if it is negative.
- 8.69 Imports and exports are both valued at the customs frontier of the exporting country. For exports, the values will be collected at prices which are "*free on board*" (fob.). The import values will be collected at prices including "*carriage, insurance and freight*" incurred between the country of origin and the importing country i.e. on a cif basis. In order to reduce the import value to a *free on board* basis reflecting the value at the frontier of the country of origin, the cif element must be subtracted from the goods value measured at the point of entry of the importing country. This cif element is then allocated to the appropriate service activities, either as imports in the case of non-resident units, and domestic output in the case of resident units providing these services.

When transport and insurance services included in the fob value of imports of goods (i. e. between the factory and the border of the country of export) are provided by resident units, they must be included in the value of exports of services by the economy importing the goods. Conversely, when transport and insurance services included in the fob value of exports of goods are

provided by non-resident units they must be included in the value of imports of services by the economy exporting the goods.

External account of primary incomes and current transfers (V.II)

- 8.70 The purpose of the external account of primary incomes and current transfers is to determine the current external balance, which, in the structure of the system, corresponds to saving by the institutional sectors. This account is a condensed version of the sequence, for an institutional sector, extending from the allocation of primary income account to the use of income account.
- 8.71 On the resources side, the external account of primary incomes and current transfers shows the external balance of goods and services. It also records, on the resources or uses side, all distributive transactions which may involve the rest of the world, apart from capital transfers.

EXTERNAL ACCUMULATION ACCOUNTS (V.III)

Capital account (V.III.1)

- 8.72 The rest of the world capital account records acquisitions less disposals of non-produced assets by non-resident units and measures the changes in net worth due to saving and capital transfers.
- 8.73 The balancing item of the capital account is the net lending or borrowing of the rest of the world. It is equal, but has the opposite sign, to the sum of the net lending or borrowing of the resident institutional sectors.

Financial account (V.III.2)

- 8.74 The layout of the rest of the world financial account is identical to that of the institutional sectors' financial account.

Other changes in assets account (V.III.3)

- 8.75 As for the institutional sectors, the changes in net worth due to other changes in volume of assets and due to nominal holding gains and losses are determined successively, holding gains and losses themselves being broken down into neutral and real holding gains and losses.
- 8.76 The absence of produced assets in the accumulation accounts and balance sheets of the rest of the world is due to the convention whereby a notional institutional unit is created, the rest of the world being deemed to have acquired a financial asset — and vice versa for assets held in other economies by resident units.

BALANCE SHEETS (V.IV)

- 8.77 The balance sheets of the rest of the world contain financial assets and liabilities. On the assets side, they also record the total acquisitions less disposals between non-resident and resident units of monetary gold and SDRs.

GOODS AND SERVICES ACCOUNT (0)

- 8.78 The purpose of the goods and services account is to show, by product group and for the total economy, the supply of products and their uses. The account is not part of the sequence of accounts, but rather an underpinning identity between the supply and use of products in the economy. It represents at aggregate level the matching of supply and use of products in the rows of the supply and use tables.
- 8.79 It therefore shows, by product group and for the total economy, the resources (output and imports) and the uses of goods and services (intermediate consumption, final consumption, gross fixed capital formation, changes in inventories, acquisitions less disposals of valuables, exports).
- 8.80 Given the way in which output is valued at basic prices and uses at purchasers' prices, taxes (less subsidies) on products must be included in the resources section.
- 8.81 Uses are recorded on the right-hand side of the goods and services account and resources on the left, i.e. on the opposite side from that used in the current accounts for the institutional sectors, since the product flows are the counterparts of the monetary flows.
- 8.82 The goods and services account is by definition in balance and therefore has no balancing item.

Table 8.17 Account 0: Goods and services account

Resources			Uses		
P.1	Output	3 604	P.2	Intermediate consumption	1 883

INTEGRATED ECONOMIC ACCOUNTS

- 8.83 The integrated economic accounts give a concise overview of the accounts of an economy: current accounts, accumulation accounts and balance sheets.

They bring together in the same table the accounts of all the institutional sectors, the total economy and the rest of the world, and balance all the flows and all the assets and liabilities. They also enable the aggregates to be read off directly.

- 8.84 In the table of integrated economic accounts, uses, assets and changes in assets are recorded on the left-hand side, while resources, liabilities, changes in liabilities and net worth are recorded on the right-hand side.

- 8.85 To make the table readable while giving a picture of the whole economic process, the levels of aggregation used are the highest compatible with an understanding of the structure of the system.

- 8.86 The columns in the table represent the institutional sectors, namely: non-financial corporations, financial corporations, general government, non-profit institutions serving households, and households. There are also a column for the total economy, a column for the rest of the world, and a column which balances uses and resources of goods and services.

- 8.87 The rows in the table represent the various categories of transactions, assets and liabilities, balancing items and certain aggregates

AGGREGATES

- 8.88 The aggregates are summary indicators of the result of the activity of the total economy and key magnitudes for purposes of macro-economic analysis and comparisons over time and space.

GROSS DOMESTIC PRODUCT AT MARKET PRICES (GDP)

- 8.89 Gross domestic product at market prices is the final result of the production activity of resident producer units. It can be defined in three ways:

- (a) production approach: GDP is the sum of gross value added of the various institutional sectors or the various industries plus taxes and less subsidies on products (which are not allocated to sectors and industries). It is also the balancing item in the total economy production account.
- (b) expenditure approach: GDP is the sum of final uses of goods and services by resident institutional units (final consumption and gross capital formation), plus exports and minus imports of goods and services.
- (c) income approach: GDP is the sum of uses in the total economy generation of income account (compensation of employees, taxes on production and imports less subsidies, gross operating surplus and mixed income of the total economy).

- 8.90 By deducting consumption of fixed capital from GDP, we obtain net domestic product at market prices (NDP).

OPERATING SURPLUS OF THE TOTAL ECONOMY

- 8.91 The gross (or net) operating surplus of the total economy is the sum of the gross (or net) operating surpluses of the various industries or the various institutional sectors.

MIXED INCOME OF THE TOTAL ECONOMY

- 8.92 The gross (or net) mixed income of the total economy is identical with the gross (or net) mixed income of the household sector.

ENTREPRENEURIAL INCOME OF THE TOTAL ECONOMY

- 8.93 The gross (or net) entrepreneurial income of the total economy is the sum of the gross (or net) entrepreneurial incomes of the various sectors.

NATIONAL INCOME (AT MARKET PRICES)

- 8.94 Gross (or net) national income (at market prices) represents total primary income receivable by resident institutional units: compensation of employees, taxes on production and imports less subsidies, property income (receivable less payable), (gross or net) operating surplus and (gross or net) mixed income.

Gross national income (at market prices) equals GDP minus primary income payable by resident units to non-resident units plus primary income receivable by resident units from the rest of the world.

National income is not a production concept but an income concept, which is more significant if expressed in net terms, i. e. after deduction of the consumption of fixed capital.

NATIONAL DISPOSABLE INCOME

- 8.95 Gross (or net) national disposable income is the sum of the gross (or net) disposable incomes of the institutional sectors. Gross (or net) national disposable income equals gross (or net) national income (at market prices) minus current transfers (current taxes on income, wealth etc., social contributions, social benefits and other current transfers) payable to non- resident units, plus current transfers receivable by resident units from the rest of the world.

SAVING

- 8.96 This aggregate measures the portion of national disposable income that is not used for final consumption expenditure. Gross (or net) national saving is the sum of the gross (or net) savings of the various institutional sectors.

CURRENT EXTERNAL BALANCE

- 8.97 The balancing item in the external account of primary income and current transfers represents the surplus (if it is negative) or the deficit (if it is positive) of the total economy on its current transactions (trade in goods and services, primary incomes, current transfers) with the rest of the world

NET LENDING (+) OR BORROWING (–) OF THE TOTAL ECONOMY

- 8.98 The net lending (+) or borrowing (–) of the total economy is the sum of the net lending or borrowing of the institutional sectors. It represents the net resources that the total economy makes available to the rest of the world (if it is positive) or receives from the rest of the world (if it is negative). The net lending (+) or borrowing (–) of the total economy is equal but of opposite sign to the net borrowing (–) or lending (+) of the rest of the world.

NET WORTH OF THE TOTAL ECONOMY

- 8.99 The net worth of the total economy is the sum of the net worth of the institutional sectors. It represents the value of the non-financial assets of the total economy minus the balance of financial assets and liabilities of the rest of the world.

GENERAL GOVERNMENT EXPENDITURE AND REVENUE

General government expenditure and revenue are defined by reference to a list of ESA categories.

- 8.100 Government expenditure comprises the following ESA categories, recorded under the use side of general government accounts, with the exception of D.3 which is recorded under the resource side of general government accounts:

P.2 Intermediate consumption

P.5 Gross capital formation

D.1 Compensation of employees

D.29 Other taxes on production, payable

D.3 Subsidies, payable

D.4 Property income, payable

D.5 Current taxes on income, wealth, etc.

D.62 Social benefits other than social transfers in kind

D.632 Social transfers in kind - purchased market production

D.7 Other current transfers

D.8 Adjustment for the change in pension entitlements

D.9p Capital transfers, payable

NP Acquisitions less disposals of non-produced assets

Government revenue comprises the following ESA categories, recorded under the resource side of general government accounts, with the exception of D.39 which is recorded under the use side of general government accounts:

P.11 Market output

P.12 Output for own final use

P.13 Payments for non-market output

D.2 Taxes on production and imports, receivable

D.39 Other subsidies on production, receivable

D.4 Property income, receivable

D.5 Current taxes on income, wealth, etc.

D.61 Net social contributions

D.7 Other current transfers

D.9r Capital transfers, receivable

By definition, the difference between general government revenue and general government expenditure is net lending (+)/net borrowing (–) of the general government sector.

The transactions D.41 (interest), D.73 (current transfers within general government), D.92 (investment grants) and D.99 (other capital transfers) are consolidated. The other transactions are not consolidated.
